incur stress tolerance (e.g. salt, cold or drought) to ensure the plants have a high mutritional value with reduced apical dominance or dwarfism, early flowering or altered metabolic pathways. This sequence represents a plant mucleic acid of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                163

The invention relates to plant nucleotide sequences that direct seed, leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential cor constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant genome and a method of identifying a gene, where its expression is altered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a creal, e.g. soybean, alfalfa, sunflower, canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, sorghum, rice or wheat. The polymucleotides and the polypeptides they encode are useful for manipulating crop plants to alter or improve phenotypic characteristics, to produce large quantities of oil or proteins, to incur resistance to insecticides, viruses or fungi, and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plant; gene; ss; transcription; plant genome augmentation; cereal; soybean; alfalfa; sunflower; canola; cotton; peanut; tobacco; sugar beet; maize; barley; sorghum; rice; wheat; crop plant; insecticide resistance; stress tolerance; salt tolerance; cold tolerance; drought tolerance; plant nutrition; apical dominance; dwarfism; early flowering; antiviral; antifungal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New rice promoter, useful for manipulating crop plants to alter or improve phenotypic characteristics, e.g. produce large quantities of oil or proteins, resistance to insecticides, virus or fungi, stress tolerance or high nutritional value.

                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of cDNA encoding AFP1, an antifreeze protein of perennial ryegrass. The cDNA was isolated from a pseudostem cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polynucleotides contains and the polynucleotides encoding them ADM41458-ADM41483. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polynucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promect. Sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The cantifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of amblecular biology creagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          380 AAAAGTTTGCAGATACGGCTCAAGAGCCTCACCACTGACAGCCAGTCACTGGGTATGGGT 439

confectionery. Anti-freeze proteins are especially used in food products, which are heated, e.g. by pasteurisation, blanching or sterilisation prior to freezing. Plants transformed with a nucleic acid sequence and anti-freeze protein have an increased frost tolerance. Prior ant anti-freeze proteins have not been applied to commercially available food products, due to high costs and complicated processes for obtaining the protein. Also prior art anti-freeze proteins have tended to destabilise during processing especially during the pasteurisation step. This is overcome by the present anti-freeze protein. The anti-freeze protein anti-freeze or anti-freeze protein and inhibition assay of 15 mu M or less. The anti-freeze protein ingredient means that mixes can be frozen under quiescent conditions, e.g. in a shop or home freezer without the formation of unacceptable ice crystal shapes and hence with a texture different to products normally obtained via
                                                                                                                                                                                                                                                                                                                                                                                           TCCGGGAGCTTTCATACCGTATCCGGGGGCACAATACTGTGTCCGGGAGCAACAATACC 300

The anti-freeze protein is characterised in that at least 40% of its amino acids are from the group of serine, threonine and asparagine. The anti-freeze protein can be used in frozen food products, especially frozen

Library. The invention provides forage grass (peremial ryegrass and tall lescue. The invention provides forage grass (peremial ryegrass and tall library. The invention provides forage grass (peremial ryegrass and tall lescue.) ADM41458-ADM41483. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polynucleotides can be used to modulate the cold cold cold cold and parts. The method involves incorporating an antifreeze of polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting to the polynucleotide into the cells of the organism, thereby inhibiting cold grown of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present sequence is that of cDNA encoding an antifreeze protein of

The present sequence is that of cDNA encoding AFP4, an antifreeze protein of perennial ryegrass. The CDNA was isolated from a leaf and pseudostem CC of perennial ryegrass. The CDNA was isolated from a leaf and pseudostem cCC constant interest of the invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polynucleotides controlled from tissues taken at different times of year (winter and spring) and from different parts of the plants. The plynucleotides can be used to condition the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded CRNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a control or a disorder characterised by biocrystals associated with disorders such as a disorder characterised by biocrystals associated with disorders such as a because the control or a method for the control or antifreeze protein can be used by associated with disorders such as a disorder characterised by biocrystals associated with disorders such as a disorder characterised by biocrystals associated with disorders such as a disorder characterised by biocrystals associated with disorders such as a disorder characterised by biocrystals associated with disorders such as a disorder characterised by biocrystals associated with disorders such and a disorder characterised by biocrystals associated with disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

The present sequence is that of cDNA encoding AFP3, an antifreeze protein

of perennial ryegrass. The cDNA was isolated from a root cDNA expression

library. The invention provides forage grass (perennial ryegrass and tall

fescue) antifreeze proteins and the polymucleotides encoding them

ADM41458-ADM41483. The polymucleotides were isolated from tissues taken

at different times of year (winter and spring) and from different parts

of the plants. The polymucleotides can be used to modulate the cold

colerance of an organism, especially plants, mammals, insects, fungi,

colerance of an organism, or introducing only estimate and bacteria. The method involves incorporating an antifreeze

polymucleotide, under the control of a gene promoter sequence, into the

genome of the organism, or introducing double-stranded RNA corresponding

corpression of an antifreeze polypeptide. The antifreeze protein can be

used for the cryopreservation of a cell or tissue, as a food additive of

a frozen food product, in a method for decreaning the time required to

composition, to treat a disorder characterised by biocrystals

cassociated with disorders such as gout and kidney stones, to presserve the

viability of a molecular biology reagent, to destroy unwanted tissue in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antifreeze proteins and encoding polynucleotides, useful for modulating cold tolerance in organisms, as food additives, or for treating tumors or disorders associated with the presence of unwanted

The present sequence is that of cDNA encoding, an antifreeze protein of perennial ryegrass. The invention provides forage grass (perennial companies) of ryegrass and tall feacue) antifreeze proteins and the polymucleotides compound the ADM41458-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from companies, fungi, archaea and bacteria. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating companies polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, contrared inhibiting expression of an antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for contrast as a food additive of a frozen food product, in a method for theories as a food additive of a frozen food product, in a method for contrast and kidney stones, to preserve the viability of a molecular biology to reagent, to destroy unwanted tissue in a patient e-g. tumour tissue, and contracted a plant from damana dissue in a patient e-g. tumour tissue, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antifreeze proteins and encoding polynucleotides, useful for modulating cold tolerance in organisms, as food additives, or for treating tumors or disorders associated with the presence of unwanted

The present sequence is that of cDNA encoding an antifreeze protein of tall fescue. The CDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue. The cDNA was isolated from a leaf blade cDNA expression continuous and the polynucleotides encoding them to ADMA1458-ADMA1483. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the polynucleotides can be used to modulate the cold cold archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting contending to the polynucleotide into the cells of the artifreeze protein can be expression of an antifreeze polypeptide. The antifreeze protein can be a frozen food product, in a method for decreasing the time required to a frozen food product, in a method for decreasing the time required to associated with disorders such as gout and kidney stones, to preserve the

The invention provides forage grass (perennial ryegrass and rall feascue) antifreeze proteins and the polymuclocideotides encoding them ADM41483-ADM41483. The polymuclocides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
different parts of the plants. The polynucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a froza food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology teagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to frost or freezing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    479

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of cDNA encoding an antifreeze protein of tall fescue. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polynucleotides encoding them ADM41458-ADM4143. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polynucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the

                                                                                                                                                                                                                                                                                      8
ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41458-ADM41483. The polymucleotides were isolated from clissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to condulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating con antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze protein can be used for the cryopresservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and

The cDNA was isolated from a leaf and pseudostem cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polynucleotides encoding them ADMA1458-ADMA1483. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from

The present sequence is that of cDNA encoding an antifreeze protein of tall fescue. The cDNA was isolated from a leaf blade cDNA expression collibrary. The invention provides forage grass (peremial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them compared and the polymucleotides encoding them compared times of year (winter and spring) and from different parts of the plants. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold colerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the collymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a control of a plant from damage due to
